

Accessibility Issues and Fixes for home.html

- Course: SWE263P User Experience & Interaction
- Name: Yu-Tsu Chang
- Date: 05/15/2026
- Scope: WCAG 2.2 Level A and AA review of [home.html](#).

WCAG	Location	Issue	How I fixed it
3.1.1 Language of Page	Original home.html, opening HTML tag	The original page did not identify the page language. Screen readers may not know which pronunciation rules to use.	I added lang="en" to the <html> tag.
2.4.1 Bypass Blocks	Original home.html, before the main page content	The original page did not provide a way for keyboard users to skip repeated navigation and header content.	I added a visible-on-focus skip link: Skip to main content, which jumps directly to the <main id="main"> section.
2.4.7 Focus Visible, 2.4.11 Focus Not Obscured (Minimum), 4.1.2 Name, Role, Value	Original CSS and navigation links	The original page used onFocus="blur();", which removed keyboard focus from links. This made keyboard navigation hard to see and use.	I removed all onFocus="blur();" handlers and added a clear focus style for links, buttons, and select controls using outline: 3px solid #000000;.
1.3.1 Info and Relationships, 2.4.6 Headings and Labels, 4.1.2 Name, Role, Value	Original QuickNav dropdown	The original QuickNav dropdown had no proper label and changed pages immediately when the user changed the selection.	I added a real <label> for the dropdown, kept the label visually hidden with .sr-only, and added a separate Go button with an accessible label. This makes the control clearer and avoids unexpected

			navigation.
3.2.2 On Input	Original QuickNav dropdown	The original dropdown used <code>onchange="location.href = this.value;"</code> , so the page changed as soon as the user selected an option. This could be unexpected for keyboard and screen reader users.	I changed the behavior so the user selects an option first and then activates the Go button to navigate.
1.1.1 Non-text Content, 1.4.5 Images of Text, 2.4.4 Link Purpose (In Context), 4.1.2 Name, Role, Value	Original left navigation	The original left navigation used image-only links such as <code>nav_home.gif</code> , <code>nav_shop.gif</code> , <code>nav_news.gif</code> , and <code>nav_survey.gif</code> . These images were used as text and the focus was removed with blur handlers.	I replaced the image-based navigation with real text links: Home, Shop, News, and Survey. I kept the same left navigation position and layout style, but made the links readable by assistive technology and keyboard users.
1.1.1 Non-text Content	Original decorative border and header images	The original page used many decorative images for borders and spacing. Some of these images had no alt text.	I kept the visual images where needed for matching the original layout, but marked decorative images with <code>alt=""</code> or <code>aria-hidden="true"</code> so screen readers do not announce meaningless decoration.
1.1.1 Non-text Content	Original product images and right-side teaser images	The original product images were used as CSS background images with <code>title="image"</code> , so they did not have useful alternative text. The right-side teaser images also did not	I changed the product images and sidebar teaser images into real <code></code> elements and added short descriptive alt text, such as the doormat, kitchen mat,

		have descriptive alt text.	exercise mat, and custom rug images.
1.1.1 Non-text Content, 2.4.4 Link Purpose (In Context), 2.5.3 Label in Name	Original “More” arrow image links	The original story cards used a morearrow.gif image as the link, with empty alt text and mouse-only hover image changes. This made the link purpose unclear.	I replaced the arrow image links with meaningful text links, such as “Learn more about doormats,” “Learn more about kitchen mats,” and “Learn more about exercise mats.”
2.1.1 Keyboard, 2.5.2 Pointer Cancellation	Original “More” arrow links	The original More arrow images used onMouseOver and onMouseOut to change the image visually. This behavior depended on mouse interaction and did not help keyboard users.	I removed the mouse-only image swap behavior and used normal text links that work with mouse, keyboard, and screen readers.
1.3.1 Info and Relationships	Original page structure	The original layout was built mainly with nested tables and presentational tags such as , <table>, and <td>. The main content and sidebar were not clearly identified by semantic HTML.	I rebuilt the structure with semantic elements including <header>, <nav>, <main>, <aside>, <h1>, <h2>, , and . I kept the same visual layout, but made the document structure clearer.
1.3.1 Info and Relationships, 2.4.6 Headings and Labels	Original title and section headings	The original page used paragraph tags and visual styling for headings, such as <p class="headline">, instead of semantic heading elements.	I changed the main page title to <h1>, the environmental section title to <h2>, and the right sidebar titles to heading elements.
1.3.1 Info and Relationships	Original environmental commitment links	The original environmental commitment section	I changed the environmental links into a real unordered

		used line breaks and inline images instead of a real list.	list using and . The bullet images are now decorative icons with empty alt text.
2.4.4 Link Purpose (In Context)	Original environmental commitment links	The original links used vague text such as “Click here.” This does not explain the destination clearly.	I replaced “Click here” with descriptive link text such as “Learn more about sustainable materials,” “Learn more about manufacturing practices,” and “Learn more about the recycling program.”
3.2.2 On Input, 2.4.4 Link Purpose (In Context)	Environmental commitment links that open in a new tab	The original links opened in a new tab with target="_blank" but did not warn screen reader users.	I kept target="_blank" but added rel="noopener noreferrer" and hidden text saying “opens in a new tab.”
1.4.1 Use of Color, 2.4.7 Focus Visible	Original link styling	Some original links were styled with text-decoration: none, so links relied too much on color. Keyboard focus was also not clearly visible.	I restored visible underlines for links and added a strong keyboard focus outline.
1.4.3 Contrast (Minimum), 1.4.11 Non-text Contrast	Original right sidebar headings	The original right sidebar used gray-blue text on a gray-blue heading background, which could be low contrast.	I changed the sidebar title area to use stronger contrast, with black text on a lighter gray-blue background.
1.4.5 Images of Text	Original phone number	The original phone number was an image, telefon_white_bg.gif, which made the phone number	I replaced the phone number image with real text: 1 800 MAT-TIMAT.

		harder to resize, copy, or read with assistive technology.	
1.4.10 Reflow, 1.4.4 Resize Text	Original fixed table layout	The original page used fixed-width tables, which can make the page harder to use on small screens or when zoomed.	I kept the original 800px visual frame for desktop, but rebuilt the layout with CSS grid and added a media query so the layout can collapse into one column on smaller screens.
4.1.2 Name, Role, Value	Original interactive elements	Some original interactive elements did not have clear accessible names, especially image links and the unlabeled select.	I used native HTML links, buttons, labels, and ARIA labels where needed. The select, Go button, navigation, and sidebar all now have clearer roles and names.

Notes

- The original page already had a descriptive <title>Welcome to Matt's Mats</title>, so WCAG 2.4.2 Page Titled was not a failure.
- I kept the top logo as an image because it functions as a brand logo. However, I gave it concise alternative text.
- I kept the decorative layout images from the original design, such as border and header separator images, but hid them from screen readers when they did not add meaning.
- I focus on WCAG 2.2 Level A and AA issues. AAA items were not required for this assignment, but some changes, such as clearer link text and better focus styling, also improve usability beyond the minimum requirement.

Extra credit notes

- I used semantic landmarks: <header>, <nav>, <main>, and <aside>.
- I used real headings instead of visually styled paragraphs.
- I used real lists for grouped environmental links.
- I used text links instead of image-only links.
- I added a skip link for keyboard users.
- I added clear focus indicators for keyboard navigation.

- I improved link text so users can understand each link without relying only on surrounding visual context.
- I kept the original visual design as much as possible while making the HTML more accessible.
